

MAD DUCK OUTDOORS

Cupped-n-Committed™ Decoy Motion System

Features

- ❖ Legal in all states
 - No motor
 - No electric power
 - No batteries
- ❖ Lightweight
- ❖ Moves Shell and Full body decoys
- ❖ Moves Silhouette decoys
- ❖ Uses existing decoys
- ❖ Patent Pending

Description

The Cupped-n-Committed™ decoy motion system is a patent pending motion system like no other that you have ever seen. It does not just make one or two decoys look like they are alive, it makes the entire decoy spread look like it's alive. It is a jerk string made for use in the field and like nothing else you have ever seen! If you hunt ducks or geese in fields, or Turkeys anywhere, you need to use these motion tops to make your decoy spread look like it is alive.

Movement in your decoys can mean the difference between landing birds and watching them circle and fly away. The Cupped-n-Committed™ decoy motion system can always provide a hunter's decoy spread with the movement it needs, day in and day out. It will always provide motion as long the hunter can move their hand. It can also do it when the wind is not blowing and without any electric power, batteries or motors of any kind. It will make motion when you want and how you want.

The movement in shell and full body decoys is created by the Waterfowl Walker™ motion top. It mimics the side to side wobble of birds walking and feeding in a field. If you ever watch a flock of birds in a field you will notice they do not all move at once. Some of them stop to feed while others wobble along to find the next feeding opportunity. This system gives the hunter the same ability to provide the same movement. One hunter can have two stakes with 6 activation cord near their blind that can control 6 decoys per cord and 36 decoys in all. But, he can select one single cord and only move 6 or select 2

cords and only move 12. Or he can select 2 cords and move 12 decoys, then pick a different 2 cords and then the last two cords or any other random variation. This system will provide the random movement of independent birds walking through a field. No other system, even the wireless remote controlled decoy motors do not have this flexibility. No other system on the market can meet the abilities of this system and do it all without wind, electric power or motors of any kind.

The Cupped-n-Committed™ decoy motion system also has the SiloFlag motion top. The SiloFlag™ motion top and it is like nothing you have ever seen before! It will put a flag to shame in the attraction power of far a way geese and ducks. Now with our SiloFlag™ motion top you can wave one to several strings of silhouettes at a flock of geese. Imagine not waving one flag but rather a dozen or more silhouettes with one hand.

The SiloFlag™ motion top can turn silhouettes decoys in 90 degree movements. This motion makes the decoys appear to disappear and reappear as they are turned 90 degrees. This makes a highly visible motion decoy like nothing else you have seen. Imagine the difference of flagging 12 silhouettes compared to one flag. Twelve moving silhouettes are far more noticeable and eye catching than one waving wing decoy.

If you need motion in your decoys the Cupped-n-Committed decoy motion can provide you with the motion you need, at any time. Try our system out and we will prove to you that we can make your decoys move. You have to see it to believe it!

With this motion system the birds will truly be Cupped-n-Committed!
